

G4E EUROPA™ Sleeveline

Chemical Service Valve
The Standard For Performance

Durco G4E Europa Valves Provide Bubble Tight Shutoff and ISO Mounting

Europa Sleeveline valves offer tighter shutoff than other rotary design valves and emissions containment equal to or better than specially designed severe service valves. They are a best choice for difficult chemical applications and for isolation of pumps, tanks, reactors and other critical equipment.

Unique tapered plug design assures reduced turning torque and in-line seal adjustment for wear. ± 5 mm (3/16 in) adjustment; plug cannot bottom out.

Rocker arm adjustment ensures positive sealing with the valve in-line.

Large seal area of the PTFE sleeve (as much as 10x greater than valves of other design) delivers positive shutoff and extended service life. Sealing is bi-directional.

Available sizes: DN 15, 20, 25, 32, 40, 50, 65, 80, 100, 125 and 150.

Raised ribs, grooves and recesses positively lock sleeve in body.

Pressure class: PN 10-40

The G4E valve has been designed according to the criteria of TRB801 No. 45 (AD-A4, DIN EN 12516-2 (calculation).

Face-to-face flange dimensions conform to EN 558-1, row 1 (ISO 5752).

Reverse lip design of the PFA diaphragm provides static and self-adjusting dynamic stem seal design. Backup stainless steel diaphragm is optional.

In-Line And Thru-Line Seal Adjustability

Positive in-line plug adjustment

The unique design of the tapered plug allows a bubble tight, adjustable seal. The plug can be pushed deeper into the sleeve by two adjuster fasteners. The rocker arm gives one plane contact and resultant force down the centerline of the plug. Uniform adjustment of the two fasteners is not necessary.

Line sealing

The interference fit of the tapered plug with the PTFE sleeve serves as the sealing surface. The sleeve totally surrounds plug ports and seals the circumference of the plug, top and bottom. There are no cavities to fill up than in ball valves. Sealing is both upstream and downstream.

- Seal is totally independent of line pressure.
- There is no metal to metal contact.
- Valve remains free-turning throughout its life and never requires lubrication.
- Seal is adjustable.
- Wiping action between sleeve and plug provides for good slurry handling.

with product, and the seal area is larger

DIN/ISO 5211 mounting

pad facilitates actuation.

Rugged, heavy-duty body may be specified in corrosion resistant stainless steels, nickel base and light reactive alloys.

Static Seal

PFA diaphragm wedges against stem with an interference fit to seal against leakage to atmosphere or air leakage into valve on vacuum service.

Dynamic Seal

Reverse lip diaphragm provides self-energizing dynamic stem seal where pressure activates the reverse lip to seal against the stem.

Positive stem seal

A PFA diaphragm with reverse lip design provides both static and self-adjusting dynamic steam sealing. This serves as a secondary atmospheric seal to the primary plug/sleeve seal. The stem seal is not normally exposed to full line pressure.

G4EB Marathon™Valves Deliver High Cycle, Positive Stem Sealing Durability

Unique stem-sealing design

The Marathon valve can be used with confidence in chemical processing applications where tight shutoff and emissions containment are priority requirements. As a bonus, its very design assures long life, high cycle performance.

Viton O-rings

A pair of Viton® O-rings prevents stem leakage while containing line pressure. They also protect the thrust collar against attack from atmospheric corrosion. PTFE back-up rings firmly lock the Viton O-rings in the stem grooves.

Optional Kalrez® O-rings are available for special services.

New welded diaphragm

The integral thrust collar/ alloy diaphragm is welded together for another line of defense against leakage to the atmosphere. The underside of the metal bellowslike diaphragm acts as an expansion joint by allowing the PFA diaphragm to adjust to plug movement and pressure changes.

The Hastelloy® C diaphragm provides an impermeable barrier to chlorine as well as many other services.

G4EB Marathon Valve

Viton O-Rings & Welded Metal Diaphragm Stem Seals Sleeve & Diaphragm cut in four places

Passing the test

In a remarkable test, lab technicians defeated the PTFE sleeve and PFA diaphragm, the G4EB's primary and secondary seals, by cutting both of them in four places. After 160,000 cycles, the G4EB emitted less than 10 parts per million of helium and showed no visible signs of stem wear.

The conclusion

G4EB Marathon valve fugitive emission containment is often equal to more expensive valves designed specifically as severe or toxic service valves.

G4EZ Fire Sealed Valves

Durco firesealed valves have been successfully used on refinery applications such as:

- Isomerization Gas plant
- Blending
- Sulfur plant
- · Light ends
- Crude desalting

Packing (Grafoil®)
Diaphragm
(Stainless Steel or Monel®)
Diaphragm (PFA)
Gasket (Grafoil)

Durco Sleeveline valves have been fire tested in accordance with the procedures set forth in API 607 Third Edition. They surpassed the external sealing requirements of Section 4, Paragraph 4.2, "Performance Requirements."

G4Z fire sealed valves have been temperature cycled to 204°C (400°F)*. They have provided performance superior to any other soft-seated valves available for temperature cycling applications.

Chlorine Valves

The Durco G4E Chlorine valve is built in accordance with the recommendations of the U.S.

Chlorine Institute. This valve is manufactured with a cast carbon steel body and a vented Monel plug for dry chlorine service. It is cleaned, dried and packaged for delivery.

Vented plug design is also recommended for other cold liquids such as anhydrous HCL.

* 232°C (450°F) with optional Duriron II sleeve.

Fire Sealed Sleeveline

valves – both G4EZ and

G4EBZ models – incorporate

special Grafoil® packing

rings at the stem and

Grafoil® gaskets at the top

cap that reduce atmospheric

leakage to a negligible

amount should fire destroy

the PTFE sleeve and

diaphragm. A metal

diaphragm keeps the

Grafoil® packing in place if

the top seal is destroyed.

Technical Data for Durco G4E Valves

Specially trimmed control valves reduce noise, cavitation and flashing while improving flow and pressure performance. Unique, self-cleaning design prevents particulate build-up and clogging.

Durco V-port alloy control valves are available in DN 25 through DN 150 sizes with full open Kv values of 3 through 400. They are available in a wide range of materials to satisfy your flow control needs.

G4E is readily actuated with Automax's SuperNova™ rack and pinion actuator and Apex 5000™ positioner with Pharos® visual position indicator.

Automax® automation equipment

Automax Inc., a wholly owned sub-sidiary of Flowserve Corporation, is a specialist in complete automation systems. Automax markets a broad line of rack and pinion, heavy-duty and electric actuators. In addition, Automax offers engineered special control cir-cuits, solenoid valves, limit switches, positioners and actuator mounting kits.

Technical Data for Durco G4E Valves

D4 = ASTM A351/A744 Gr. CF8M (316 Stainless Steel); DS = ASTM A216 Grade WCB (Cast Steel); D100 = ASTM A351/A744 Gr. CD4M Cu (Durcomet 100); DMM = ASTM A494 Gr. M35-1 (Monel 400); DNI = ASTM A494 Gr. CZ-100 (Nickel 200);

Testing assures Durco dependability

Durco G4E valves are a revolutionary design. They incorporate all the best design and construction improvements that have been made in soft-seated valves since Flowserve Corporation introduced the original non-lubricated plug valve in 1950.

G4E valves have been extensively tested to ensure, insofar as possible, a completely reliable process valve.

The unique reverse lip stem seal has been tested from -46°C (-50°F) to 204°C (400°F) maximum, and with pressures up to 4960 kPa (720 psig). For higher temperatures contact your Flowserve Sales Office.

High temperature throttling tests at 204°C (400°F) with pressure drops of 1205 kPa (175 psig) have proven the superiority of the G4E valves over other soft-seated valves. Ask your Flowserve Sales Representative for specific test results.

The valves have been temperature cycled to 204°C (400°F), and have provided performance superior to any other soft-seated valve available for cyclical temperature situations.

We believe the G4E valve is the best soft-seated valve on the market today, and will outlast and outperform all competitive valves.

Pressure-temperature ratings

The pressure-temperature ratings of all the materials above are based on mechanical property requirements cited in the latest DIN, ASTM or ANSI specifications.

Valves may require adjustment to remain drop tight at the lower end of temperature range when operating below -17°C (0°F) or in extreme temperature cycles.

Special Note: Flowserve pursues an aggressive and continuous product development program. As a result, Flowserve reserves the right to alter specifications without notice.

Technical Data for Durco G4E Valves

Manual valve turning torque*

The turning torque of a PTFE sleeved plug valve is determined by two primary factors: setting of the plug to hold line pressure; and operating conditions (temperature, corrosion deposits, frequency of operation, etc.). All G4E valves 150 mm and smaller are air tested at ambient temperature. The gas closure test is in agreement with ANSI B16.34, 1988 for both the Class 150 and Class 300 valves. The average turning torques for new valves are shown in the table below.

Flowserve Material

Flowserve Corporation has devoted more than 90 years to the development of alloys and the production of equipment to provide long, trouble-free life when handling severe corrosives. Flowserve, valves, pipe, fittings, and various accessory castings are among the equipment engineered and produced by Flowserve Corporation in various nickel-base alloys, iron-base alloys, and reactive alloys.

Corrosion charts for these alloys are available to provide assistance and reference in selection of alloy for specific service conditions.
